

Backend Software Engineer (Python / AI Automation)

NexaCloud Systems | Remote | Full-time

Job Summary

We are looking for a Backend Software Engineer with 2-4 years of experience to design, build, and maintain REST APIs and automation tools that power our cloud platform. The ideal candidate is comfortable working across the stack from database design to deployment, and has hands-on experience integrating AI/LLM APIs into production workflows.

Key Responsibilities

- Design and develop scalable REST APIs using Python frameworks such as FastAPI or Flask.
- Build internal automation tools to streamline operational workflows.
- Integrate large language model APIs (e.g. Gemini, OpenAI) into backend services.
- Write and maintain SQL queries and manage relational databases.
- Collaborate with the DevOps team on containerized deployments using Docker.
- Participate in code reviews and maintain version control best practices using Git.
- Monitor and improve system performance and operational efficiency.

Required Skills & Qualifications

- Bachelor's degree in Computer Science or related field.
- 2+ years of professional experience with Python.
- Strong understanding of REST API design and development.
- Experience with SQL and relational databases.
- Familiarity with Git and collaborative version control workflows.
- Experience with Docker and containerized application deployment.
- Prior experience integrating third-party or AI APIs into applications.

Preferred (Nice to Have)

- Experience with Java or additional backend languages.
- Exposure to cloud platforms (AWS, GCP, or Azure).
- Experience building internal dashboards or admin tools.
- Prior work on AI-powered automation or productivity tools.

What We Offer

Competitive salary, fully remote work, flexible hours, and the opportunity to work directly on AI-driven products from an early stage.
